

Oasis Practice Management Software

Patient Files

How to improve the storage, retrieval and analysis of patient demographic information.

Patient Photographs

Of course, Oasis enables you to link a photograph to each patient card through a variety of methods including file, twain and scanner, making it easier for staff to identify patient records.

Optimised Retrieval

Any patient record card can be instantly retrieved using a variety of search methods including patient surname, first name, postcode, date of birth, telephone number etc. OASIS uses optimized SQL algorithms, so regardless of the size of your database, you can find any record literally within seconds.

Electronic Cards

The OASIS PATIENT FILES module ensures that all patient information is recorded efficiently and permanently on computer file instead of on manual cards that can get tatty or lost.

OASIS draws the electronic patient card on the computer screen and you use this form to enter in new patient details and link patient photographs. You can customize many of the card details to suit your own practice requirements.

On the card you can also link referring doctors and other patients.

In general practice, patient cards can be grouped into families. OASIS provides a range of easy to use facilities for quick transfer of cards across families and creation of new family cards.

Once entered on file, patient cards can be easily retrieved by a variety of methods.

A large range of reports is available for listing and analyzing your patient database including Practice Statistics and Query Report Writer.

Optimised Family Records

OASIS has been highly optimized to make it easier to work with family records. Simply record the bill payer (Family Head) and then use this patient's defaults for adding new family member records. A change of family details such as address or phone numbers can be easily processed across all family member cards. Likewise, shifting patients across to different family cards or changing family member status is easily accomplished.

Working your Database

Naturally, as you build up years of patient information in your OASIS system, you will want facilities to analyse data. We give you a standard patient master list report generator to produce simple patient reports. You can also use any of our optional database access tools including our Statistics and Query Report Writer to extract data in a variety of formats. Best of all—because OASIS is SQL compliant, you can use a variety of third party programs such as MS Query, MS Access, MS Word or Crystal Reports to access this information.

Envelopes and Labels

OASIS lets you define up to 99 Custom Forms—this is ideal for patient sticky labels or envelopes.

Any patient card information can be printed and we give you a number of sample templates to work with.

Direct Referrals

OASIS lets you link one patient to another—enabling you to keep track of direct patient referrals—great for practice building.

You can also link the patient to up to 5 referral entities—including referring doctors, specialist practices and the like.
